

Run this terminal command in your custom_scripts directory to automatically generate the README.md file locally:

Bash

```
cat << 'EOF' > README.md
```

```
# Custom Tampermonkey Userscripts Repository
```

This repository contains custom Tampermonkey userscripts designed to enhance and automate workflows on the **Tech24 Dashboard** (<https://tech24et.com/cases>).

All scripts in this repository are configured to automatically sync and update via GitHub Raw URLs using Tampermonkey's native update engine.

📁 Repository Structure & Script Mapping

File Name in Repository	Script `@name` Header	Purpose
:---	:---	:---
`tech24-case-timestamp-sync.user.js`	`Tech24 Case Timestamp Sync (Ultra-Fast Edition)`	Automates background case search, date/time parsing, and syncing timestamps with Google Apps Script bridge.
`tech24-sla-duration.user.js`	`Tech24 SLA & Duration Columns`	Calculates and renders business-hour SLA duration metrics directly in the dashboard UI.

⚙️ Metadata Header Specifications

Every userscript file in this repository **MUST** end with the `.user.js` extension and contain valid `@updateURL` and `@downloadURL` directives pointing to the raw `main` branch file.

Template 1: Timestamp Sync Header

```
``javascript
// ==UserScript==
// @name      Tech24 Case Timestamp Sync (Ultra-Fast Edition)
// @namespace  tech24-case-sla-sync
// @version   4.1
// @description Instant loading, dynamic logging, flexible date formatting, and open-case handling.
// @match     [https://tech24et.com/cases](https://tech24et.com/cases)*
```

```
// @updateURL
[https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-case-timestamp-sync.user.js](https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-case-timestamp-sync.user.js)
// @downloadURL
[https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-case-timestamp-sync.user.js](https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-case-timestamp-sync.user.js)
// @grant      GM_xmlHttpRequest
// @connect     script.google.com
// @connect     script.googleusercontent.com
// @connect     *
// ==/UserScript==
```

Template 2: SLA & Duration Header

```
JavaScript
// ==UserScript==
// @name      Tech24 SLA & Duration Columns
// @namespace  tech24-sla-duration
// @version   1.0
// @description Calculates business-hour SLA durations for Tech24 dashboard.
// @match     [https://tech24et.com/cases](https://tech24et.com/cases)*
// @updateURL
[https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-sla-duration.user.js](https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-sla-duration.user.js)
// @downloadURL
[https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-sla-duration.user.js](https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-sla-duration.user.js)
// @grant     none
// ==/UserScript==
```

Guidelines for AI Agents & Developers

When modifying code in this repository, any automated agent or human developer **MUST** adhere to the following operational rules:

1. **Mandatory Version Increment (@version):**

- Every code modification or bug fix **MUST** be accompanied by an increased `@version` tag in the `==UserScript==` header block (e.g., bump 4.1 -> 4.2).
- *Reason:* Tampermonkey checks the raw file for a higher version number string. Without a version bump, clients will not receive the update.

2. File Naming & Pathing:

- Keep web-safe, kebab-case file names (tech24-case-timestamp-sync.user.js).
- Do not alter `@name` or `@namespace` values arbitrarily, as changing them causes Tampermonkey to register a new script instead of updating the existing installation.

3. External Requests & Permissions:

- If adding new external API endpoints or network targets to a script, add matching `@connect <domain>` tags to the header to prevent browser cross-origin policy blocks.

4. Zero Browser-Side Edits:

- Never modify code directly inside the Tampermonkey browser dashboard UI. Direct edits disable automatic update syncing for that client.

Development & Release Cycle

[Local Edit / AI Refactor]

[Bump `@version` in Header]

[Commit & Push to main Branch]

[Tampermonkey Auto-Polls Raw GitHub URL] —▶ [Client Script Updated]

Standard Git Release Commands

Bash

1. Stage changes

git add .

2. Commit with version reference

git commit -m "Refactor date parser and bump version to 4.2"

```
# 3. Push to remote main
git push origin main
```

Live Raw Direct Links for Installation

To install or reinstall scripts directly into Tampermonkey:

- **Timestamp Sync:**
https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-case-timestamp-sync.user.js
- **SLA Duration:**
https://raw.githubusercontent.com/YoHighnessM/custom_scripts/main/tech24-sla-duration.user.js
EOF

<Image alt="GitHub README Markdown File Guide" caption="GitHub README Markdown File" src="image_agent_tag_16608877488902585777"/>

Once created, stage and push the file to your repository:

```
```bash
git add README.md
git commit -m "Add repo documentation and AI instructions"
git push origin main
```
